

LOCKING MECHANISM**ABSTRACT OF THE DISCLOSURE**

The present invention concerns a locking mechanism (100) including a plate (110) and a base (112). The plate has a first projection (122), a second projection (124) and a first surface area (118) for receiving a decorative image (120). The base has a first slot (130) and a second slot (132) in which the first slot runs at least substantially along a first axis (A_1) that is at a predetermined angle with respect to a vertical axis (V_1) of the base, and at least a portion of the second slot runs at least substantially along a second axis (A_2) that is at least substantially perpendicular to the first axis.
